Abstract: 1-Acetyl-5-(4-nitrophenyl)-3-(2-pyridinyl)-2-pyrazoline was synthesized by the Claisen-Schmidt condensation of 3-(4-nitrophenyl)-1-(2-pyridinyl)-2-propene-1-one in presence of hydrazine hydrate in acetic acid and its cobalt complex have been synthesized and characterized on the basis of elemental analysis, molar conductance, molecular weight determination and spectral data like ¹H NMR, IR. These compounds were screened for their antibacterial activity against gram positive and gram negative bacteria.

Key words: 2-pyrazoline, Cobalt complex, Spectral Analysis, Antibacterial activity.

1. Introduction

Pyrazolines are well known important nitrogen containing five member heterocyclic compounds. They have only one endocyclic double bond and are basic in nature. A classical synthesis of these compounds involve the base-catalyzed aldol condensation reaction of aromatic ketones and aldehydes to give α, β - unsaturated ketones (chalones) which undergo a subsequent cyclization reaction with hydrazines affording 2-pyrazolines¹. They have found to possess antifungal, anticonvulsant, antidepressant, anti-inflammatory, antibacterial, anticancer, antioxidant, antiviral, antiamoebic and antituberculosis activities²-16. Some of these compounds have also analgesic activity and COX-2 inhibitor¹⁷-¹⁸. The prevalence of pyrazoline core in biological active molecules has stimulated the need for elegant and efficient ways to make these heterocyclic lead. Several folds by coordination with suitable metal ion, apparently due to the accretion in lipophilicity of the metal chelates¹⁹. In the present study, we have investigated the interaction of Co(II) with some newly synthesized pyrazolines. All the prepared compounds were screened for their antimicrobial activities.

2. Experimental

Materials and methods

All the reagents and solvents used were of laboratory grade. The synthesis of new products was monitored by TLC using (Ranbaxy) silica gel-G plates for TLC. IR spectra are recorded on Shimadzu FTIR 8400 (4000-400 cm⁻¹). ¹H NMR spectra are recorded on BRUKER AVANCE III NMR 400 MHz spectrometer using TMS as internal standard. Conductance values were determined in dry DMSO at 10⁻³M concentration on a digital conductivity meter NDC 732. C, H and N analysis were performed on an automatic elemental analyzer model Vario EL III. Copper was estimated by the atomic absorption spectrophotometer (Element AS, Model AAS 4141).
Synthesis of Ligand

The ligand was synthesized in two steps:

**Step – I : Synthesis of 3-(4-nitrophenyl)-1-(2-pyridinyl)-2-propene-1-one (chalcone) (3)**

Acetylpyridine (0.02 mol) was dissolved in 5 percent methanolic sodium hydroxide (30 ml) with constant stirring and 4-nitrobenzaldehyde (0.02 mol) was added dropwise into it at 0-5°C with continuous stirring for 2 hr. The stirrer was removed and the reaction mixture was kept over night. The reaction mixture was poured on ice cold distilled water, neutralized with dilute sulphuric acid and filtered, washed with cold distilled water, dried and the resulting chalcone was purified by recrystallization from methanol.

**Step – II : Synthesis of 1-acetyl-5-(4-nitrophenyl)-3-(2-pyridinyl)-2-pyrazoline (4)**

A solution of 3-(4-nitrophenyl)-1-(2-pyridinyl)-2-propene-1-one (0.01 mol) in acetic acid (35 ml.) was refluxed with hydrazine hydrate (2.5 ml., excess) for 5-15 hrs. The progress of reaction was monitored by TLC. The reaction mixture was cooled overnight and poured onto ice-water. The separated solids was filtered, washed with distilled water, dried under vacuum and re-crystallized from methanol.
Experimental Data

Ligand Yield: 85%, m.w. 278.11 gm/mole; $^1\text{H NMR}$ (400 MHz, DMSO-$D_6$)$\delta$: 7.196-8.693 (8H, m, Ar- H & pyridinyl H), 5.578 – 5.621 (1H, dd, C$_3$-H$_{cis}$), 3.267-3.327 (1H, dd, C$_4$-H), 3.155-3.211 (1H, dd, C$_4$-H$_{trans}$), 2.370 (3H, s, COCH$_3$); $\text{IR (KBr)} \nu_{\text{max}}$ cm$^{-1}$: 1676 (C=O), 1519 (C=N), 1415 (C=C), 1344 (C-N), 854 (N-N). Anal. Calcd for C$_{16}$H$_{14}$N$_4$O, C, 69.0; H, 50.7; N, 20.1%. Found C, 68.7; H, 50.3; N, 20.0%.

Cobalt Complex: Yield: 67.0%, m.w. 729 gm/mole; $\text{IR (KBr)} \nu_{\text{max}}$ cm$^{-1}$: 1641 (C=O), 1507 (C=N), 1328 (C-N), 896 (N-N), 495 (M-O), 420 (M-N); Anal. calcd for C$_{32}$H$_{30}$CoN$_8$O$_7$S, C, 52.6; H, 4.1; N, 15.3; Co, 8.0% Found C, 52.3; H, 3.8; N, 15.1; Cu 7.9%.

3. Antibacterial Activity

Antibacterial activity of the ligand and metal complex was evaluated at Department of Microbiology, M. L. Sukhadia University, Udaipur (Raj.). The synthesized compounds were screened for antibacterial activity by agar disc diffusion method against gram-positive bacteria Micrococcus luteus, Staphylococcus aureus and gram-negative bacteria Escherichia coli. Nutrient agar (Microgen, India) was used for bacteria culture. The culture strains of bacteria were maintained on nutrient agar slant at 37±0.5ºC for 24 hrs. The known compounds amoxicillin was used as standard drug for antibacterial comparison study. The compounds were tested at a concentration at 500 $\mu$g/ml in DMSO. The diameter of zone of inhibition was measured in mm. DMSO was used as a control. Around 30 ml. of sterile nutrient agar media for bacteria was poured into sterile petri dishes and allowed to solidify. The media was seeded with the organism by spread palate method using sterile L-roads and loops. Holes of 6 mm. diameter were punched carefully using a sterile cork borer and these were completely filled with the test solutions. The bacterial petri plates were kept in incubator at 37ºC for 24 hrs. and then the zones of inhibition were measured.

4. Result and Discussion

In the present work, Claisen-Schmidt condensation of substituted aromatic ketone with aldehyde in alkaline methanol yielded 1, 3 – diaryl-2-propen-1-one. The required ligand was obtained by the reaction of 1, 3-diaryl-2-propen-1-one with hydrazine hydrate in acetic acid. The cobalt complex was synthesized by reacting the respective ligand and metal ion solution in 2:1 stoichiometric ratio in alkaline medium. The synthesized ligand and complex were characterized by elemental analysis and spectral measurements. All the compounds are coloured solid, non-hygroscopic at room temperature. The $^1\text{H NMR}$ spectra of the ligand showed a multiple in the region 7.196-8.693 ppm assigned to the aromatic protons of phenyl and pyridinyl moieties. The acetyl protons appeared in the regions 2.370 ppm as singlets. The Cis C$_5$-H was absorbed at downfield 3.267- 3.327 ppm as compared to its trans analogue 3.155-2.111 ppm. A double doublet in the region 5.578 – 5.621 ppm was assigned to C$_5$-H. The integral proton ratio of various groups in the spectrum of each ligand was tenable with the proposed structure.

![Fig.1 : $^1\text{H NMR}$ spectra of Ligand](image-url)
IR spectra of these ligand gave characteristic absorption frequencies in the region 1676 cm\(^{-1}\) and 1519 cm\(^{-1}\) assigned to \(\nu(C=O)\) and \(\nu(C=N)\) vibration respectively. The stretching vibration for aromatic (C=C) appeared in the region 1415 cm\(^{-1}\) and \(\nu(C-N)\) vibrations were observed in the regions 1344 cm\(^{-1}\). A strong band in the region 854 cm\(^{-1}\) was attributed to \(\nu(N-N)\).

**Fig.2 : IR spectra of Ligand**

Cobalt (II) complex suggested a bidentate behaviour of the ligand which were found to coordinate through pyridyl nitrogen and carbonyl oxygen. The coordination through pyridyl nitrogen and carbonyl oxygen was indicated by negative spectral shift of \(\nu(C=N)\) vibration 1507 cm\(^{-1}\) and \(\nu(C=O)\) vibration 1641 cm\(^{-1}\). The participation of nitrogen was further confirmed by shifting of \(\nu(N-N)\) frequency to a higher wave number 896 cm\(^{-1}\). The non-ligand bands observed in the region 495 and 420 were assigned to \(\nu(M-O)\) and \(\nu(M-N)\) modes respectively. A strong band at 1030-1250 cm\(^{-1}\) in the spectra of complex suggests the presence of SO\(_4^{2-}\) ion in unidentate manner. A broad band at 3000-3500 cm\(^{-1}\) in the spectra suggest the presence of water molecule.

**Fig.3 : IR spectra of Cobalt Complex**

The cobalt complex of ligand showed maximum activity against M. luetus as comparison with the ligand HL which showed moderate activity. The cobalt complex displayed the highest antibacterial activity against M. luteus and S. aureus under study, this was because of increasing of lipophilic layer of these complex and the chelation process dominantly effects the biological behaviour of the complex that is potent against microbial
strains. The biological activity of the ligand and its metal complex is less as compared to the standard drug, the complex are more active than ligand.

5. Conclusion

Present research work involves synthesis of novel pyrazoline derivative and their cobalt complex to explore their antibacterial activity. Cobalt complex exhibited highest antibacterial activity against M. luteus, S. aureus and E. coli. The observed increase in antibacterial activities is attributed to the presence of pyridinyl moiety of synthesized compounds. Hence, it is concluded that there is ample scope for further study in developing these as good lead compounds for the treatment of bacterial strains.

6. Acknowledgement

We are thankful to HOD, Department of Chemistry, and Department of Pharmacy, Pacific University, Udaipur for providing necessary facilities and encouragement for the present research work. We are sincerely thankful to Department of Chemistry (NFDD Center), Saurashtra University, Rajkot for IR and 1H NMR spectral analysis. We are also thankful to Department of Mines and Geology, Udaipur (Raj.) for AAS and Elemental analysis and Department of Microbiology, MLSU, Udaipur (Raj.) for providing antibacterial activity. One of the author of this paper Dr. Mamta Ahuja is thankful to UGC, New Delhi for Major Project.
