ABSTRACT: The study was carried out to identify through scientific methods the active ingredients and the pharmacological activities of the shoot and root extracts of Mimosa pudica Linn. The Mimosa pudica shoot methanolic extract (MSME), Mimosa pudica root methanolic extract (MRME) showed very good wound healing activity when compared to the standard drug Gentamicin. Whereas Mimosa pudica root Chloroform extract (MRCE) showed negative result. The isolated compounds were characterized by instrumental analysis, UV and IR.

KEYWORDS: Mimosa pudica, wound healing activity, MSME, MRME

INTRODUCTION

Mimosa pudica\(^1,2\) Linn is a sensitive plant belonging to the family Leguminaceae, distributed in Brazil, India. Mimosa pudica is well known for its rapid plant movement. The plant shows a peculiar movement NYCTYNASTIC movement i.e. the leaflets fold together in the evening and the whole leaves droops downward. It then reopens at sunshine. The leaves also close up under various other stimuli such as touching, warming or shaking. The shrubs can also be transmitted to neighbouring leaves. This type of movement is called SEISMONASTIC movement.

The treatment of diseases in early days has begun by using various medicinal plants. They served as a good tool in altering different clinical conditions. Our land is having a vast heritage of knowledge and expertise in herbal medicine from different cultures and civilization. The purpose of the plant work is to identify the active ingredient through scientific methods and to study the pharmacological activities of the plant in shoot and root extracts of mimosa pudica.

MATERIALS & METHODS

The plant “Mimosa pudica” was collected from Mathar in Kanyakumari district, Tamilnadu at 4.00 pm. The plant specimens were authenticated at the Institute of Sidha Medicine, Tamil University, Tanjavur and a voucher specimen was kept at the Department of Pharmacognosy, SSRCP, Mahabubnagar.

EXTRACTION PROCESS

The fresh shoot and root are used for extraction. The shoots were extracted by 5 hrs with petroleum ether, 12 hrs with chloroform, 24 hrs with methanol and water.

for 24 hrs. In root except petroleum ether, chloroform, methanol and water by hot continuous extraction using soxhlet apparatus.

250gm of shoot and root were coarsely separated and extracted separately. The extracts were collected separately and concentrated by vacuum dessicator. The concentrated extracts were then dried by keeping in vacuum dessicator. All the details are depicted in Table 1 and 2.

Preliminary Phytochemical Screening Analytical Studies By Thin Layer Chromatography

The preliminary identification studies were carried out by standard protocol TLC with solvent system of Chloroform and Methanol (85:15) and are given in Table no:3 and 4

Preliminary Phytochemical Screening Analytical Studies By HPTLC6

The HPTLC of Methanolic shoot extract showed red light brown green, light green, light green, light green, light green, light green, dark brownish green and dark orange colour spot. The Rf value ranges 0.31 to 0.94 and isolated crystal show dark greenish orange spot of the Rf value 0.94 and dark greenish orange of the Rf value 0.80. The chromatogram was visible under UV light. Silica gel precoated aluminum foil as absorbent, Chloroform: Methanol (85:15) as solvent system and UV Chamber at 255 nm as detector are used for identification studies.

Apparatus

The HPTLC system model 30/june/2006 ID: 7D6061E0E320458

It is used in Track: laud2, noise level 0.381AU, U4065/N: 0612A004CAMAG SOFTWARE

(c) 1998 Wave length 356 nm

QUALITATIVE CHEMICAL EVALUATION 7

All the extracts obtained were subjected to qualitative tests for various plant constituents and observed that presence of glycosides, Phytosterol and alkaloids as major active constituents are confirmed by suitable chemical tests.

FORMULATION8,9,10:

Ointment Formulation: shown in Table no:5

Type: Water miscible base.

Method of preparation: Mixed the ingredients, heated gently with stirring until homogeneous mixture forms. Stirred to cool.

Types of ointment prepared

There are two types of ointment are prepared, Ointments are...

1. Base + Root Methanolic Extract
2. Base + Shoot Methanolic Extract
3. 20 % concentration of ointment was prepared.

Method of preparation: In this preparation 100 mg of suitable extract is mixed with 500 mg of ointment base (20%). Then it is stirred well until homogeneous base is obtained.

PHARMACOLOGICAL SCREENING

Animal: Wister Albino rats (150-200gms)

Procedure

Wister Albino rats (150-200gms) were selected and made into four groups of 6 animals each for the experiment. The animals were housed in the experimental room (SSRCP Mahabubnagar) which was maintained as per IAEC guide lines.

The experimental animals were anaesthetized using lignocaine 2% injections, over the local selected region. The rats were deplated over the region excision wound was infected by cutting a way of 5mm square thickness of skin from the predetermine area, the wound was left and rest to the open environment then the drugs reference standard (0.01 % w/w gentamycin ointment) control (simple ointment BP) only Mimosa pudica extract both shoot & root in Methanol extract is applied. (10 % w/w simple ointment) were applied till the wound was healed. This model was used to monitor the wound contraction and wound closer time. Wound contraction was calculated as % reduction in wound area. The progressive change in wound area is monitored by calculating the decreasing area.

General formula as follows:

RWH = Size of Wound in surface area (mm²) at Day 9 / Size of Wound in surface area (mm²) at Day 1 ×100% Reduction in Healing =100- RWH

The effect of topically applied Mimosa pudica Shoot and Root extract ointment on excision wound of mice is shown as Table no:6

RESULTS & DISCUSSION

The present work is the pharmacological studies on the extracts of Mimosa pudica. The soxhlet extraction procedure carried out using coarse dried shoot and root with by successive solvent petroleum ether, chloroform, methanol and water. The preliminary chemical analysis indicates the presents of alkaloids, glycosides and phytosterols.

The wound healing activity was studied by using four groups, the groups are, Group I negative control simple ointment, In Group II positive control Gentamicin. 0.01%w/v, Group III MSME and Group IV MRME.

Contraction of the excision wound was promoted from Day 1 of the treatment till Day 9. The epithelization of wound in case of mice treated with extracts was found to be quite earlier than control. It is also comparable with the marketed preparation. It suggest that the shoot and root extracts of Mimosa pudica promoted wound healing activity. The excision wound model showed significant wound healing property of the shoot and root extracts of Mimosa pudica which was well compared with standard drug. The results are shown in Table 1.
