# Synthesis of Novel phenoxy - isobutyric acid derivatives, Reaction of ketone under Bargellinic reaction conditions 

K. Nagan Nirmalan, N. Ramalakshmi<br>Department of Chemistry, Presidency College, Chennai- 600 005, Tamil Nadu, India

#### Abstract

In the present study, we report the synthesis of high quality alpha-phenoxy isobutyric acid derivatives were carried out by the reaction. Phenol or substituted phenol dissolved with acetone excess amount of sodium hydroxide is added. After added chloroform, reaction mixture was refluxed for several hours to give alpha-phenoxy - isobutyric acid. The isolated acid was treated with thionyl chloride and its corresponding alchol to produce alpha phenoxy isobutyric acid derivatives. We summarized the synthetic methodologies, yield, structural characteristics (NMR, Mass spectrum and C, H, N analysis) in their properties.

Key words: Ketone under Bargellinic reaction.

## Introduction

The Bargellinic reaction in which phenol is condensed with acetone and chloroform in the presence of strong base to produce a sterically hindered $\alpha$-phenoxy-isobutyric acid derivatives ${ }^{1}$. The synthesis of $\alpha$-phenoxy - isobutyric acid derivatives strategy utilizes the Bargellinic reaction as the key bond forming step ${ }^{2}$. Several compounds were prepared by this route. The mechanism for this unusual condensation reaction was investigated ${ }^{3}$. Synthetic tool in organic synthesis and various nucleophiles and ketones have been employed in place of classic form. In this manner it has potentially been a constructive lead for the organic chemists. Generally Bargellinic type reaction dichloroepoxide intermediate are formed by the reaction of chloroform and ketones which are potentially active toward regioselective ${ }^{4}$ nucleophile attack (scheme -1 ). The recent years have witnessed an increased activity in the area of $\alpha$-phenoxy- isobutyric acid derivatives synthesis. $\alpha$-phenoxy - isobutyric acid derivatives are persistent free radicals that exhibit remarkable stability primarily due to the absence of dimerization and disproportionation ${ }^{5}$. Their unique properties have sparked considerable interest from theoretical, chemicals and biological standpoints ${ }^{6}$.

## Experimental

Liquid substances were distilled prior to use. Melting points were uncorrected. 1HNMR spectra were measured on a Bruker Avance $400(400 \mathrm{MHz})$ spectrometer using TMS as the internal standard. Elemental analysis were measured on a (HERAEUS CHNO, Rapid) analyzer. Sonication were performed in Shanghi

Branson- CQX ultrasonic cleaner (with a frequency of 25 KHz and a nominal power 250 W ) and SK 250 LH ultrasonic cleaner (with a frequency of $40 \mathrm{KHz}, 59 \mathrm{KHz}$ and nominal power 250 W Shanghai Kudos ultrasonic Instrument Co., Ltd.) The reaction flask were located in the cleaner where the surface of reactants is slightly lower than the level of the water. The reaction temperature was controlled by addition or removal of water from ultrasonic bath.

## Preparation-1:

The preparation of $\alpha$-phenoxy isobutyric acid derivatives (scheme-1) phenol (21.2mmol), acetone $(20 \mathrm{~mL})$, Sodium hydroxide 215 mmol ) were mixed in a 50 mL round bottomed flask. The reaction mixture was stirred at room temperature for a period of 0.5 hrs . A mixture chloroform 127 mmol and acetone 10 mL were added over a period of 3 hrs . Exothermic were observed controlled the reaction mixture below $55^{\circ} \mathrm{C}$. The reaction mixture was stirred at $53-55^{\circ} \mathrm{C}$ for $40-52$ hrs. After completed the reaction solvent was distilled out under reduced pressure. The resulting suspension was quenched with 40 mL water, the reaction mixture was extracted with diethylether ( $3 \times 10 \mathrm{~mL}$ ). The organic layer was discarding. The obtained aqueous layer to added 2 N hydrochloric acid adjusted the $\mathrm{pH}=3$ to 4 . The solid was filtered and give the crude product solid which was separated by column chloromatography on silica ( $200-300 \mathrm{mesh}$ ), eluted with ethyl acetate and n-hexane (incorporated in Table-1).

## Preparation -2:

The preparation of $\alpha$-phenoxy isobutyric acid ester derivatives (scheme-2) $\alpha$-phenoxy isobutyric acid (preparation-1) ( 1.87 mmol ), thionyl chloride 5 mL were added then reflux for 3 hrs . The reaction mixture was distilled out at reflux temperature. The resulting suspension was quenched with benzene 5 mL the reaction mixture was distilled out at reflux temperature to remove the traces of thionyl chloride. The resulting mixture was charged isopropanol $(2 \mathrm{~mL})$ and pyridine $(1.83 \mathrm{mmol})$ the reaction mixture was heated to reflux for 0.5 hrs at $65^{\circ} \mathrm{C}$. The reaction mixture was cooled to room temperature. The reaction mixture was extracted with diethylether $(3 \times 10 \mathrm{~mL})$. The combined organic layers were washed aqueous bicarbonate ( NaHCO 3$)$ solution and brine, dried over anhydrous magnesium sulfate for 2 hours and filtered; diethyl ether was evaporated under reduced pressure to give the pure product (incorporated in table-1).

## Result and discussions:

In the present study synthesis of $\alpha$-phenoxy - isobutyric acid derivatives and esters was our initial objective. With the ultimate goal of producing pure $\alpha$-phenoxy - isobutyric acid and its esters produced in the Bargellinic reaction with unsymmetrical ketones ${ }^{7}$. It is an example of the Bargellinic reaction in which a ketone, nucleophile and chloroform react in the presence of a strong base. Deprotonation of the chloroform by sodium hydroxide followed by nucleophile attack the ketone yields dichloroepoixde. The hindered O-C bond is formed via regioselective opening by the nucleophile an aromatic alcohol substituted phenol in the present example ${ }^{8}$. An aromatic alcohol would be close to the lactone via the acid chloride subsequently hydrolysis of the lactones in the strong basic medium leads to the observed products. The excess moles of acetone, chloroform and base then acid treatment to get the observed product $(\mathbf{I})^{9}$.

## Mechanism:

The fundamental reaction is phenol or substituted phenol (Aldrich chemicals, $98 \%$ pure) is dissolved in anhydrous acetone and then excess amount of sodium hydroxide flake is added (scheme-1) ${ }^{10}$. The corresponding sodium phenylate precipitates refluxing is affected and then excess amount of chloroform diluted with anhydrous acetone is added and the resulting mixture is refluxed for $40-52$ hours. Normally these reaction 10 to 12 equivalent sodium hydroxides were used. After complete the reaction ${ }^{11}$, acetone is evaporated then added water and aqueous phase is washed with ether then followed by acidification ( 2 N HCl ). During 2 N hydrochloric acid addition solid is thrown out. Adjusted the $\mathrm{pH}=3-4$ stir the reaction mixture for 1 hour at room temperature. The solid obtained is filtered and given water wash and air dried ${ }^{13}$. The solid obtained is passed through a column chromatography used ethylacetate and n-hexane as eluvent (Example in table I).

## Scheme-1:

Scheme-2:

The standard procedure for the synthesis of $\alpha$-phenoxy - isobutyric acid esters (scheme-2) involves the refluxing of a reaction mixture of an $\alpha$-phenoxy - isobutyric acid derivatives and thionyl chloride, acid conversion into acid chloride then added concern alcohol with base $\left(\mathrm{R}=\mathrm{H}, \mathrm{CH}_{3} \mathrm{CO}, \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{CO}\right.$, etc., The intermediate of acid chloride is unstable. A mixture of $\alpha$-phenoxy - isobutyric acid derivatives with thionyl chloride is heated to reflux for 3-5 hours, distilled out slowly thionyl chloride at atmosphere distillation. Reaction is monitored by TLC after complete distillation benzene was charged. Benzene was distilled out to removes traces of thonly chloride. Charged alcohol ( $\mathrm{Y}=$ Methoxy, Ethoxy, etc., ) and pyridine as inert solvent ${ }^{14}$. Stir the reaction mixture for $1-2$ hours at $65^{\circ} \mathrm{C}$, cool the reaction mixture at room temperature. The mixture is poured into a separator funnel and diethyl ether and water were added. Separated and the aqueous layers was extracted with diethyl ether three times. The combined diethyl ether extracts were dried over anhydrous sodium sulphate filtered and concentrated. The impurity was removed by acid base treatment to obtained $\alpha$-phenoxy isobutyric acid esters in table-I gave examples of p-carbonyl phenoxy isobutyric acid derivatives which are used as intermediate compounds for the preparation of the esters according to this invention ${ }^{15}$.

Table-1:

| Compound | R | Yield | Time/ hours | Compound | R | Y | Yield |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | H | 82\% | 48 | 12 | H | $\mathrm{OCH}\left(\mathrm{CH}_{3}\right)_{2}$ | 89\% |
| 2 | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CO}$ | 65\% | 45 | 13 | $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CO}$ | $\mathrm{OCH}_{3}$ | 55\% |
| 3 | $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}$ | 75\% | 44 | 14 | $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}$ | $\mathrm{OC}_{2} \mathrm{H}_{5}$ | 46\% |
| 4 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CO}$ | 55\% | 52 | 15 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CO}$ | $\mathrm{OCH}\left(\mathrm{CH}_{3}\right)_{2}$ | 45\% |
| 5 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{CO}$ | 68\% | 41 | 16 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{CO}$ | $\mathrm{OC}_{2} \mathrm{H}_{5}$ | 56\% |
| 6 | $\mathrm{CH}_{3} \mathrm{CO}$ | 73\% | 48 | 17 | $\mathrm{CH}_{3} \mathrm{CO}$ | $\mathrm{OC}_{2} \mathrm{H}_{5}$ | 41\% |
| 7 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CO}$ | 86\% | 41 | 18 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CO}$ | $\mathrm{OCH}_{3}$ | 65\% |
| 8 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CO}$ | 92\% | 47 | 19 | $\mathrm{CH}_{3}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CO}$ | $\mathrm{OCH}_{3}$ | 76\% |
| 9 | $3,4 \mathrm{Cl}_{2}-\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{CO}$ | 59\% | 48 | 20 | $3,4 \mathrm{Cl}_{2}-\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{CO}$ | $\mathrm{OCH}\left(\mathrm{CH}_{3}\right)_{2}$ | 83\% |
| 10 | $2,6 \mathrm{Cl}_{2}-\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{CO}$ | 63\% | 45 | 21 | $2,6 \mathrm{Cl}_{2}-\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{CO}$ | $\mathrm{OC}_{2} \mathrm{H}_{5}$ | 80\% |
| 11 | Cyclohexyl-CO | 79\% | 43 | 22 | Cyclohexyl-CO | $\mathrm{OCH}\left(\mathrm{CH}_{3}\right)_{2}$ | 67\% |
